

Due date: Wed Nv 26th at 3pm**Objective: Write a multi-step job that defines and manipulates a VSAM cluster.****This assignment uses knowledge learned in modules 10 (COND, OUTPUT) and 11 (VSAM).**Create a member called **ASS3** in your PDS for this course.**Use the template when writing this assignment. It's found on KC02131.SLC.PDS called VSAMASS3.**

- Step 1: Add an OUTPUT statement that will automatically have all output routed to class H, double spaced. **Use the null class for all SYSOUT's.**
- Step 2: Add a jobstep that has IDCAMS to **delete the cluster**. Add an if statement to the utility control statements to reset the max cc if the condition is 8.
- Step3: Add a jobstep that has IEBGENER create a temporary data set on VIO **that will be used later in the job**. Use the data found on the KC02131.SLC.PDS called STUDTRAN as its **instream data**. Request the space currently used by the file and no more. Do not code a secondary allocation. Release unused blocks. Use a blocking factor greater than 5.
- Step 4: Add a jobstep that uses IDCAMS to **define a KSDS cluster** called KC03???.COMP52.VSAM. See Student Transcripts Data Set below for its record layout. Allow 70% FREESPACE for the control interval and 30% for the control area. Request the same amount of space that you allocated for the temporary data set you created in step 1 above. Protect from deletion for 45 days.
- Step 5: Add a jobstep that has IDCAMS **list the catalogue** for the cluster just to ensure the KSDS file was just created.
- Step 6: In one step; use IDCAMS to **load and print** (in character format) the KSDS file. Print and copy data from the temporary data set you created above into the KDSD file. Use the **COND** parameter to ensure that both the temporary and VSAM data sets were created with a condition code of 4 or less before this step is executed. Delete the temporary data set when this step ends.
- Step 7: Add a jobstep that has IDCAMS to **delete the cluster**.

Note: Use a referback whenever possible and remember to pass files.

Record Layout for the Student Transcripts Data Set	Field	Columns	Length
	Student Number (key)	1-5	5
	Name	6-25	20
	Sex, M/F	30	1
	Year of birth, YY	31-32	2
	Date of first admission, YYYY	33-36	4
	Major	40-41	2
	Credits attempted	45-47	3
	Credits completed	48-50	3
	Grade point average	51-53	3

What to hand in:

Transfer your output to word and use its text highlighting feature to highlight your name on the JOB statement, the condition codes issued, the number of records that were copied into the VSAM data set and the volume serial number that the data set was placed on.

Ensure all JCL statements and allocation messages appear in the output file.

Submit all of the output produced, not the source code, to Blackboard for assignment#3 in the assignment folder. Submit a Word document only, not zipped. Use XDC to transfer the output file.

Marks will be lost for not submitting as requested!*Follow the coding standards (posted on Blackboard)*

& Blackboard

Note: *If you are unable to submit your job without any errors, please show me the source code as well as any output produced for assistance before the due date. If, by the due date, you still have errors, hand in your source code, as well as the output showing the errors.*

~~~~~To obtain a grade, you must have a condition code of zero~~~~~
